

A search to the origin and meaning of the name Querner

What was known:

The first Querner came from Hamburg to Medenblik in the Netherlands around 1788. He was a shipwright/carpenter (Publication from 'West Friese Families:, Grofsmeden, broodbakkers en schoolmeesters: DE FAMILIE QUERNER', Sept 1981, no. 3, pp. 65-79).

My parents got some information while travelling in Sweden (around 1954), that the name *Querner* had something to do with milling, since it was an old word in Swedish and/or Finnish.

Around 1995 internet started and a Querner living in USA contacted me. His predecessors came also from Germany. At that time, there were about one hundred names of Querner in the USA telephone directory.

Since the information on the internet is growing recently I decided to start again a small search.

Quern Stones, used for grinding corn, seem to have been produced on Wharnccliffe Crag (UK) since the Iron Age and continued at least into Roman times.

Information on *Wharnccliffe Crag*s:

Wikipedia: The rocks at the north-western end of Wharnccliffe Crag have been quarried to produce quern-stones as long ago as the Iron Age, continuing into the period of the Roman occupation of Britain. The name Wharnccliffe actually evolved from the term "quern cliff". The process of quern production has left behind considerable evidence in the area of the crags, including work flooring and track ways as well as many abandoned querns. In August 1996 an accidental heather fire burned away much of the vegetation over an area of 8

hectares, revealing many more quern-stones than had originally thought present. A survey by English Heritage in 2000 uncovered around 2300 stones in the 8-hectare area, leading to an estimate that there could be around **8000 quern-stones** in the quarry area.

Wikipedia: Quern-stones are stone tools for hand-grinding a wide variety of materials. They were used in pairs. The lower, stationary, stone is called a quern, while the upper mobile stone is called a hand stone. They were first used in the Neolithic to grind cereals into flour. Quern-stones have been used throughout the world to grind materials, the most important of which was usually grain to make flour for bread-making. They were generally replaced by millstones once mechanised forms of milling appeared, particularly the water mill and the windmill, although animals were also used to operate the millstones. However, in many non-Westernised, non-mechanised cultures they are still manufactured and used regularly and have only been replaced in many parts of the world in the last century or so.

Further information found:

Saddle querns (2 figures below) were used for grinding corn. Grain was put on the concave lower stone and broken by moving the long-rounded stone backwards and forwards over it. They were replaced by rotary querns in the Roman period and then by water-powered mills (source: <http://www.bbc.co.uk/ahistoryoftheworld/objects/eYP-aS2vRiy4TIEgwzNCcQ>).

There are lots of informative plaques inside the mill, and the chance to try grinding flour by hand using a quern.

The English Collins Dictionary:

Quern A stone hand mill for grinding corn (Old English cweorn; **related to Old Frisian quern**, Old High German kurn, Old Norse kverna, Gothic quairnus millstone)

Origin: before 950; Middle English; Old English cweorn; akin to Old Norse kvern; hand-mill

Encyclopæida Britannica:

Quern: ancient device for grinding grain. The saddle quern, consisting simply of a flat stone bed and a rounded stone to be operated manually against it, dates from Neolithic times (before 5600 BC). The true quern, a heavy device worked by slave or animal power, appeared by Roman times. Cato the Elder describes a 2nd-century-BC rotary quern consisting of a concave lower stone and a convex upper, turned by a pair of asses. Many such large querns were found in the ruins of Pompeii. The upper stone was set on a spindle that fitted into the lower. The ground grain passed down through holes in the lower stone.

Back to a Dutch search: kweern

So in Dutch kweern is a hand driven millstone! Now we know that on the word quern in Dutch no information was found.

In our region around 2000 BC. They were growing barley, and later wheat, oats and rye. Corn digests easier if you remove the cover "bran" and the pellet breaks with a mortar or a rubbing stone. This is especially a female task. Hand mixers or kweernen make the job easier and less tiring. By means of a vertical handle a stone can be rotated around an axis, on top of another.

The Romans made quern stones by shaping them and smoothing them with metal hand tools. They used igneous rocks - rocks is formed through the cooling and solidification of magma or lava. Basalt was the favourite one. When igneous rock was not available, sandstone, quartzite or limestone was used.
